CLAIM AMENDMENT

Please amend the claims as follows:	
1.	(Canceled)
2.	(Canceled)
3.	(Canceled)
4.	(Canceled)
5.	(Canceled)
6.	(Canceled)
7.	(Canceled)
8.	(currently amended) A method for <u>using a first computer system to</u> remotely testing <u>monitor</u> the operation of a <u>second</u> computer system <u>through a graphical user interface of said second</u>
	the operation of a second computer system anough a graphical user interface of said second

computer system, comprising the steps of:

- receiving a first graphical element of said second computer system graphical user interface at said first computer system;
- generating a user input action within said <u>second</u> computer system <u>graphical user</u> interface responsive to said <u>first element receiving step</u>:
- monitoring said second computer system graphical user interface from said first

 computer system for an expected second graphical element within a

 predetermined time interval; and
- signaling a failure <u>at said first computer system</u> if said predetermined time interval elapses without detecting said expected second <u>graphical</u> element.
- (currently amended) The method of claim 8 wherein further comprising the steps of:
 - transferring said user input action to a stored script stored on said first computer system;
 - re-executing said steps of receiving, generating, monitoring and signaling subsequent to said storing step under control of said stored script.
- (currently amended) The method of claim 8 wherein further comprising the steps of:
 providing graphical user interface language extensions commands to a scripting language; and

passing said generated user input action through said graphical user interface

11.

language extensions from said a scripting language processor to a language extensions processor.

(currently amended) The method of claim 8 further comprising the steps of: generating a user input action within said second computer system responsive to said

second graphical element;

monitoring said second computer system graphical user interface for an expected third graphical element within a predetermined time interval; and signaling a failure at said first computer system if said predetermined time interval elapses without detecting said expected third graphical element.

(currently amended) The method of claim 8 further comprising the steps of: 12.

> depicting said second computer system graphical user interface upon a local display of said first computer system including said first graphical element; and receiving a local user input action at said first computer system within said local display:

wherein said generated user input action emulates said local user input action.

(currently amended) The method of claim 8 wherein further comprises comprising the steps 13. of:

providing graphical user interface language extensions commands to a scripting language; and

depicting said computer system graphical user interface upon a local display of said

first computer system including said first graphical element;

receiving a local user input action within said local display;

transferring said user input action to a stored script stored on said first computer system:

passing said generated user input action through said graphical user interface language extensions from said a scripting language processor to a language extensions processor for reproduction at said second computer system graphical user interface, wherein said generated user input action emulates said local user input action; and

re-executing said steps of receiving, generating, monitoring and signaling subsequent to said storing step under control of said stored script.

14. (currently amended) A programmerator method for enabling a local system to remotely operate a remote computer system through a graphical user interface on said remote computer system by using local scripts and that selectively respond to changes in graphical displays upon a said graphical user interface of said remote computer system, comprising the steps of:

- a command capture interface that displays displaying a depiction of said remote system graphical user interface display on said local system;
- and captures <u>capturing</u> user input made therein <u>effected in said depiction of said</u> remote system graphical user interface <u>display</u>;
- a command language set that when processed by said local system implements both of implementing through a local system command language set user input emulations representative of said captured user input at said remote computer system:
- and image processing of said remote computer system graphical displays to detect

 changes in said graphical display upon said graphical user interface of said
 remote computer system:
- a scripting language having scripting commands that control controlling a flow of
 execution of said local system through a scripting language having scripting
 commands in combination with said command language set responsive to a
 detection of changes during said image processing step; and
- an interface for communicating between said local system and said remote computer
 system graphical user interface through a communication interface responsive
 to said command and scripting languages flow controlling step.

operate a remote computer system through a graphical user interface on said remote computer system of claim 14 further comprising the steps of:

a means for storing said scripting commands into a storing means;

a means for inserting a command from said command language set into said storing means; and

a means for executing said inserted stored command.
